

Administration of 0.25ml (6 months – under 36 months) of Influvac

1. The 0.5 ml syringe for Influvac is not graduated.
2. For administration of a 0.25 mL dose (i.e. half the 0.5 ml dose) from the syringe, eject the air from the syringe.

3. Discard half the vaccine (approximately 0.25ml) by pushing the front side of the plunger exactly to the rim of the hub (the knurled polypropylene ring).

4. A reproducible volume of vaccine (0.25 ml) remains in the syringe suitable for administration.
5. Administer the remaining vaccine (IM) in the normal way.
